

# Serendipitous Services

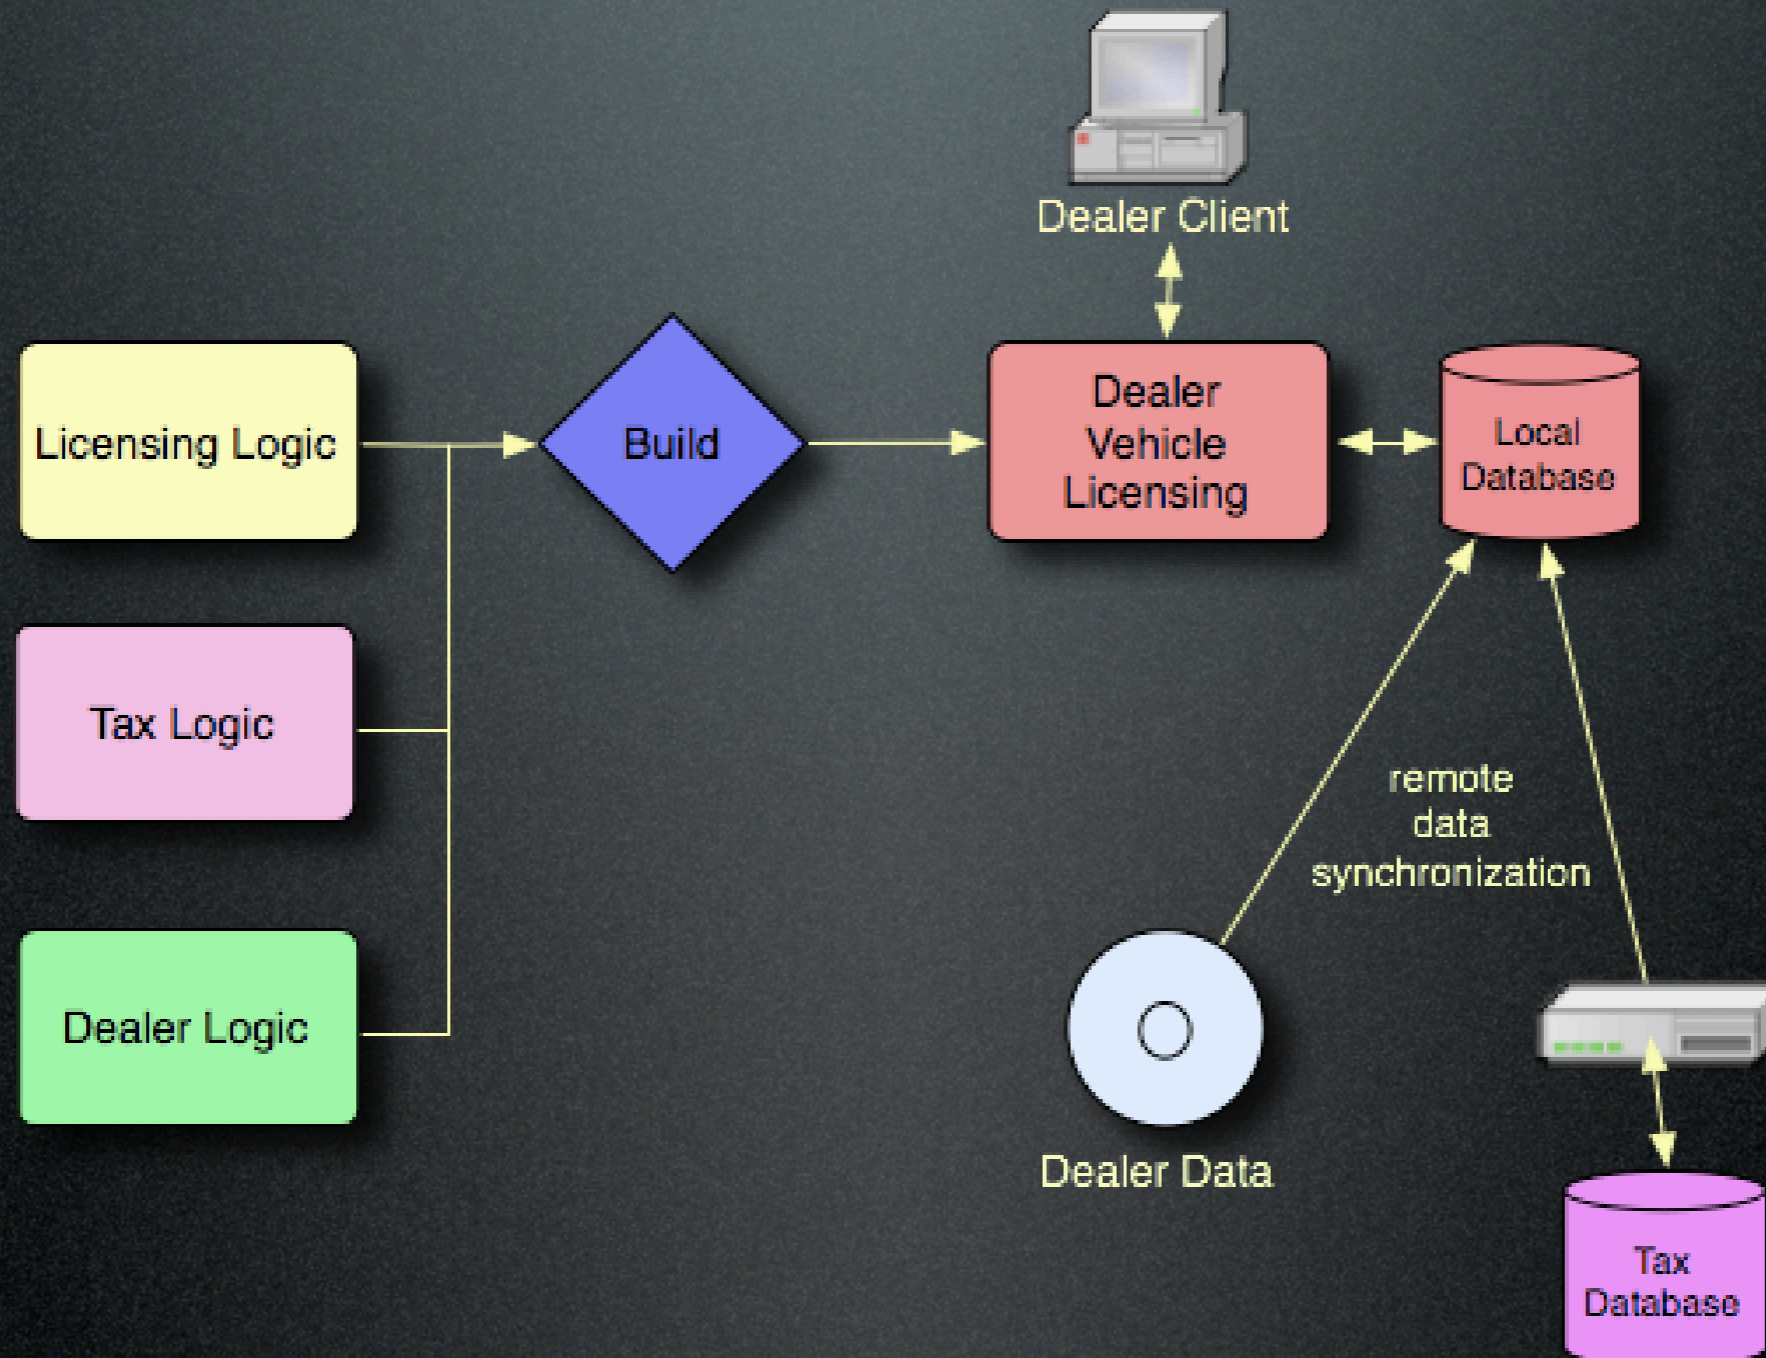

Phillip J. Windley, PhD  
Brigham Young University  
[phil@windley.com](mailto:phil@windley.com)  
[www.windley.com](http://www.windley.com)

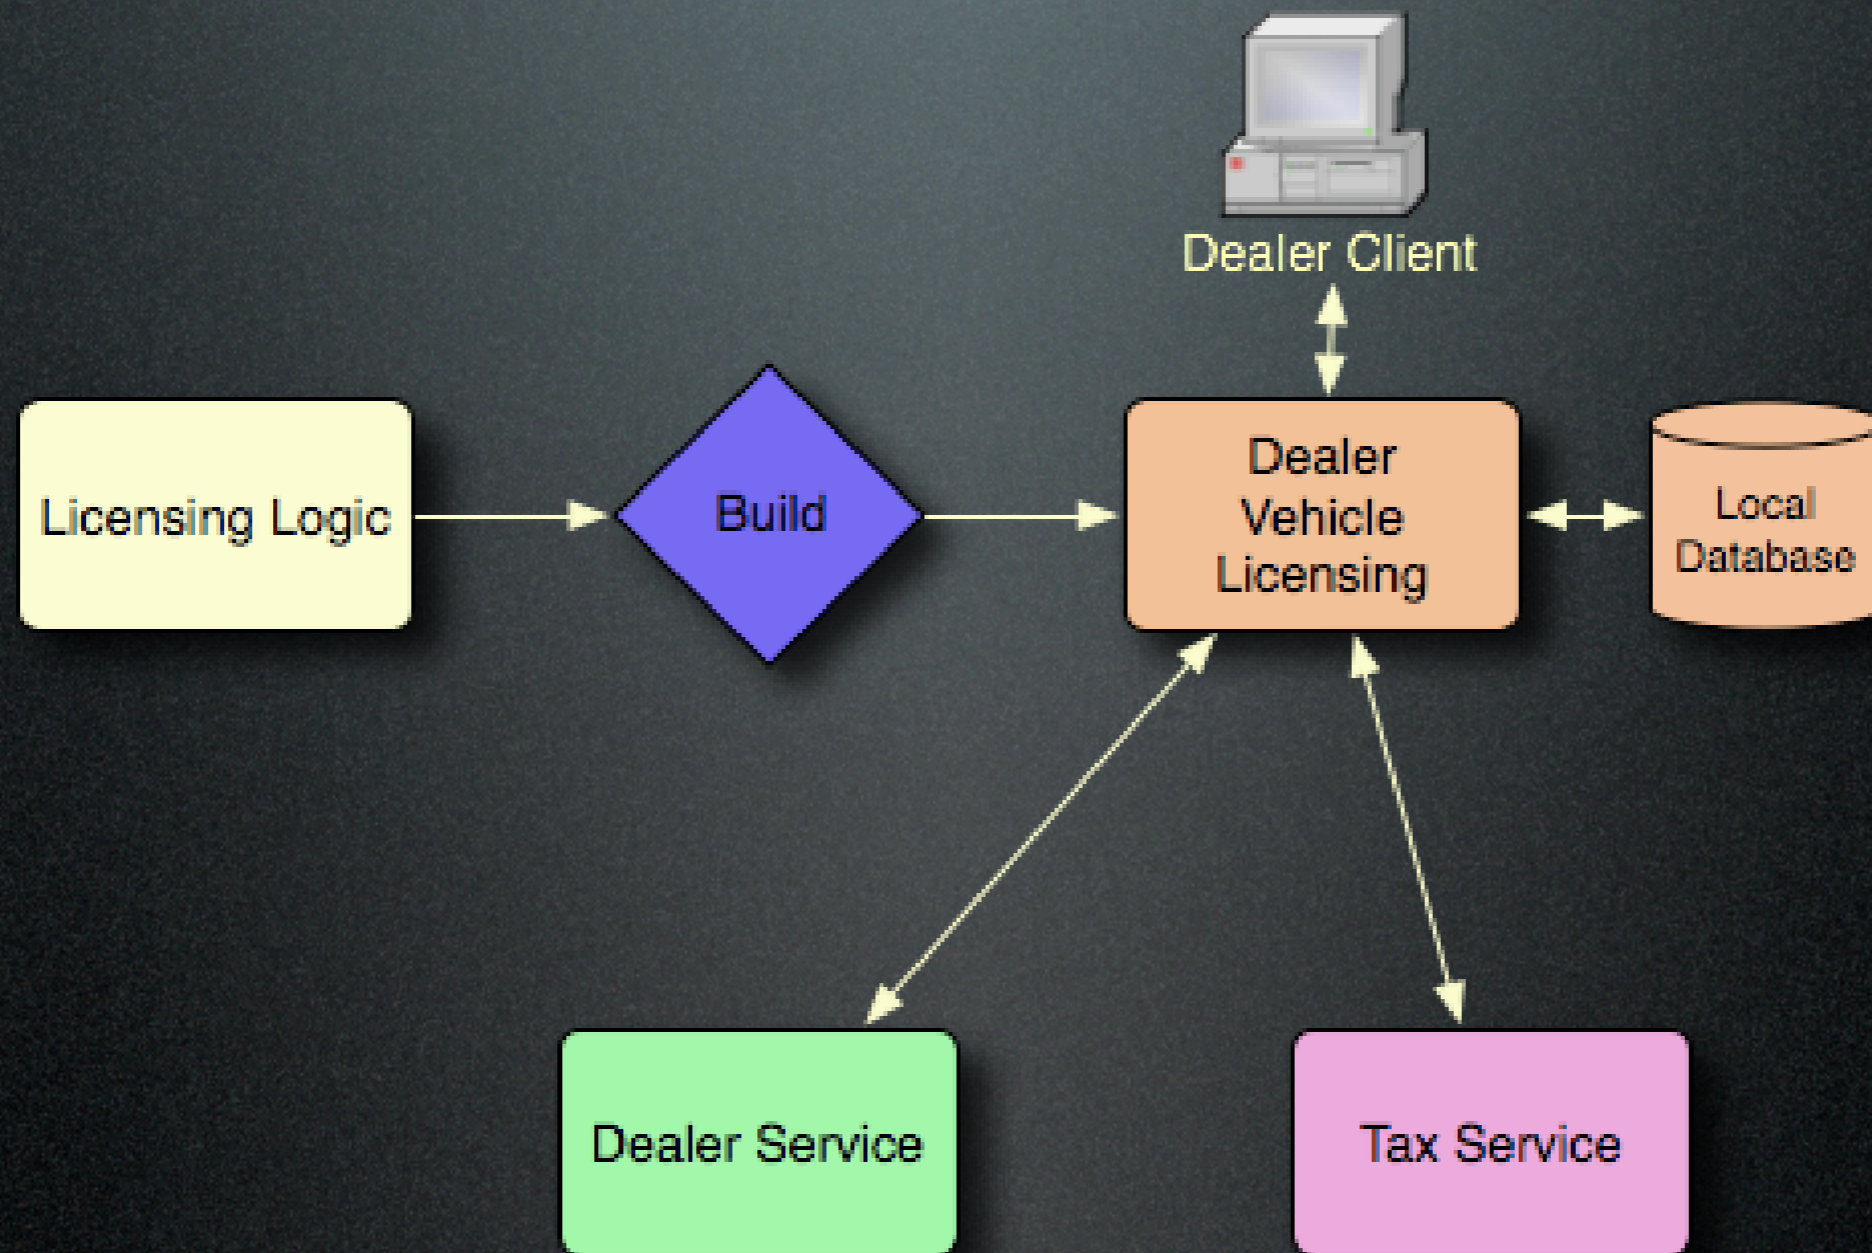

# Railroad and Highways

# Traditional Architecture

# Service Oriented Architecture

# Web Services

- Web services are self-contained pieces of code with three distinguishing properties:
  - Communicate in an interoperable XML protocol, such as SOAP.
  - Describe themselves in an interoperable XML meta-format, such as WSDL.
  - Federate globally through XML based registry services, such as UDDI.
- **Not** defined in terms of SOAP, WSDL, and UDDI.

# Key Differences

- Creating applications by
  - integrating **network** services
  - that are **very far away**
  - and owned by **strangers**
- Primary abstraction:
  - network services
  - not subroutines or objects

# Decentralized Computing

- **Decentralized** computing is different from **distributed** computing
- Decentralization means **crossing** organizational boundaries
- Extending a system to achieve consensus and cooperation between several separate organizations

# Scaling in the Internet

- Effective services scale in three ways:
  - across time
  - across space
  - across organizations
- Level-3 routers (TCP) solve these problems for connectivity

# Passenger Name Records

“PNRs unlock data stored in tickets, tariff filings, baggage claim checks, catering orders, security profiles, credit records, and myriad other components of this half-real, half-virtual distributed system called an airline”

# Service Oriented Architecture Properties

- Discoverable and dynamic
- Loosely coupled
- Locationally transparent
- Diversely owned
- Interoperable
- Composable
- Network addressable
- Self healing

# Loose Coupling

	Tight Coupling	Loose Coupling
Interface	Classes/methods	Fixed verbs
Messaging	Procedure call	Document passing
Typing	Static	Dynamic
Synchronization	Synchronous	Asynchronous
References	Named	Queried
Ontology	By prior agreement	Self describing
Schema	First-order	Higher-order
Communications	Point to point	Pub/Sub
Interaction	Direct	Brokered
Evaluation	Eager	Lazy
Motivation	Efficiency, performance	Interoperability
Behavior	Planned	Adaptive
Coordination	Centralized	Distributed
Contracts	Implicit	Explicit

# Service Oriented Architecture Benefits

- Code Re-use
- Correctness
- Maintainability
- Productization
- Security
- Focused developer roles
- Better alignment with business goals
- Scalability
- Feature augmentation

# A Word of Warning

- Good architects should do everything they can to avoid data serialization.
  - Web services is nothing but serialization.
- When serialization cannot be avoided, it can be mitigated through caching in some cases.
  - SOAP over HTTP makes caching difficult (uses POST).

# Latency

- Absolute limit of system architecture
- One of the few physical limits on computation
- New York is always going to be 30ms from London regardless of Moore's Law

## [A Lisp Interpreter in Haskell](#)

Defmacro.org has an excellent little [article](#) on using Haskell to build a working Lisp interpreter—at least a good start at one. I do something similar with my 330 class using Gofer (an outdated dialect related to Haskell). I mostly use Gofer to show them how type inference works, but since they're studying interpreters, they might as well see an [inerpreter in Gofer](#) while we're at it.

It's been too long since I've known monads well enough to decipher what he does at the end. I'm going to have to go back and review and then look at his article again—if you don't understand monads before, I doubt you'll get why they're so powerful.

# How Does This Work?

- Amazon and most library software follows principles I'll outline in a minute
- As a result, the bookmarklet can coordinate two different Web services to produce a useful application
  - **Just** Javascript
  - Small, incremental effort

# Serendipitous Services

- Start Web services now:
  - Incrementally expose your data
  - Incrementally expose your APIs
- The more data and APIs that you expose the greater the potential interoperability
- Small marginal cost and high return, but...design is important

A POX on Your House  
(with any luck)

every data element  
and collection is a  
**resource**

every resource **must**  
have a URI

cool URI's don't change

return XML

preserve the structure of data  
until the last possible moment

describe data

make XML schemas

available online

adhere to **existing** data  
standards

RSS and Atom are de facto formats

use **metadata** for XML  
(RDF)

# use HTTP correctly

data queries on existing resources  
should be done with a **GET**

use **POST** to create new resources

document your service  
API

advertise the presence  
of the service

use WSIL

use <link/> tags

use HTTP  
authentication

adopting these  
principles is **cheap**  
and **easy**...

...but it can have **big**  
rewards

# Brainstorming Two Websites

this is happening **in**  
**spite of** poor design  
and even official  
contempt

## Turtle Beach Noise Cancelling Headphones Review

The Turtle Beach Noise Cancelling Headphones had a pretty steep hill to climb with me right from the start, because I have a [middle outer](#) ear that is apparently atypically small, meaning there is nary a set of buds that will stay in my head for more than a few seconds at a time. These headphones were no exception, worming their way out of my ears (especially the left) every few seconds, as if the noise was coming out of the speakers like a jet flume. They were comfortable—the foam wrappers seem especially thick—but oversized and awkward.

      <title>Standards-Based Slide Shows</title>
      <link>http://www.windley.com/2004/10/29.html#a1498</link>
      <description>&lt;p&gt;
If you've been looking for a way to create slides in XHTML and CSS, Eric Meyer has just the thing for you. &lt;a href="http://www.meyerweb.com/eric/tools/s5/" &gt;S&lt;sup>5</sup>&lt;/sup> is a slide show system&lt;/a&gt; constructed from CSS, XHTML, and Javascript
which runs in most browsers. Run through the &lt;a href="http://www.meyerweb.com/eric/tools/s5/s5-intro.html" &gt;introductory slide
show&lt;/a&gt; to get a feel for its features (including slide advance when the space bar is pressed and a disappearing navigation menu). All
the slide content is in a single file, so once its loaded it&apos;s loaded. What&apos;s more, since its based on CSS, printable slides are
constructed from the same source file automatically. I don&apos;t think I&apos;m ready to give up Keynote and Powerpoint just yet, but for
some things, this might come in real handy.
&lt;/p&gt;</description>

# How Do I Create RSS?

- Edit by hand (not recommended)
- Blog and content management software
- Calendaring tools
- Custom applications
  - RSS libraries for most programming languages

# RSS Uses

- Aggregate feeds onto Web sites
- Portals
- Press releases
- Calendars
- Del.icio.us
- Enclosures and podcasting

# RSS Web Services

- Simple, HTTP-based Web service
- Easy to create, easy to use
- RSS is an email replacement for many applications
  - No Spam, pull instead of push
- Works for infrequent updates (and frequent ones)

# RSS and ATOM

Adam Bosworth on RSS:

- General data interface
- Represent sets
- ATOM API provides CRUD functionality

# Cautions

- What about **security**?
- What about **privacy**?

# Cautions

- What about **security**?
- What about **privacy**?
- **Identity!!!**
- Start with public data and learn skills

# What Haven't We Talked About?

- Digital identity
- SOAP-based SOA
- Governance
- Registries, intermediaries
- Formal organizations

# Summary

- First steps:
  - Don't let the **hype** scare you
  - Don't try to **boil the ocean**
  - Adopt **simple** principals
  - Jump in and **do something**
  - Start with **public** data
- The keys are
  - Plain Old XML (POX)
  - Incrementally exposing data and APIs

# The End

Questions?
